

Datalitics code style guide

Functions

- CamelCase
- Name should state exactly what it does
- Parameters should not be vague (x,y,z) unless it is obvious what is happening
- Avoid lengthy functions (more than 20 lines)
- Should do one main thing

Variables

- CamelCase

JavaScript specific

- Don't chain to make '.'s on one line
- Aim for one '.' per line to better demonstrate what is happening

Indents

- Use tab spacing

IDE

- Brackets

Modularity

- Keep modularity in mind when writing functions so that if a team member would like to transplant the function into their code they are able to.
